

***PRESS RELEASE***

**MEGA URANIUM LTD.: "MGA" (TSX-V)**

**FOR IMMEDIATE RELEASE: February 1, 2006**

**NEW GOLD ZONES DISCOVERED IN FIRST DEATY CREEK DRILL CORE  
SHEBANDOWAN CAMP, THUNDER BAY, ONTARIO**

- **Gold mineralization over 85m in hole DC-06-1**
- **Gold zones in DC-06-1: 0.24g/t to 4.12g/t in 3.5m to 12m wide zone**
- **Gold zones in DC-06-2: 0.12g/t to 7.18g/t over 7.85m including 2.07g/t over 4m**
- **Copper-molybdenum to gold phases indicated along 7.0 km property**
- **Surface samples 500m apart carry gold values in pyrite alteration zone**

Toronto, Ontario, Canada, February 1, 2006 – Mega Uranium Ltd. ("Mega") (MGA-TSX-V) (through its Maple Minerals division) and East West Resource Corporation (TSX-V: EWR) are pleased to report the discovery of new gold occurrences on the Deaty Creek property.

**Geological Details:**

Surface samples contain gold values of 0.2 g/t to 3.67 g/t, which consists of disseminated pyrite zones in pink altered volcanic rocks. These were exposed when preparing drill sites. Some samples contain only anomalous copper with values ranging up to 2400 ppm (0.24%), however, higher copper values do not necessarily correspond to higher gold values since pyrite and magnetite appear to be the most common minerals in the gold bearing silicified, altered rocks (see samples on L51E). It is important to note that these are not quartz veins but are wide spread alteration zones. These zones were previously documented and constitute new mineral discoveries. The zones also correlate with IP (Induced Polarization) anomalies and magnetic anomalies that each extend up to 800m in length. Drill holes are planned on several en échelon anomaly zones that occur along a 2.0 km strike length, from L40E to L60E, and new lines are being cut to allow geophysical surveying to detail the westward extension of the targets toward the Hamlin property. Preliminary observations suggest that there is copper-molybdenum to gold zonation within the extensive alteration zone identified along the 7.0 km length of the Hamlin to Deaty Creek property.

Deaty Creek Surface Samples						
Ticket #	Grid Line	Grid Stn.	Silver Ag (g/t)	Copper Cu (ppm)	Gold Au (g/t)	
639129	L51E	6+90S	1.5	258	0.77	
639130	L51E	6+90S	3.6	158	3.67	
639131	L51E	6+90S	0.8	227	0.28	
639142	L46E	5+85S	1.6	2400	0.41	

31.1 grams = 1 troy ounce

Drill holes DC-06-1 and DC-06-2 on lines 59E and 58E (spaced 100m apart), respectively, have also intersected gold values within a wide-spread alteration system consisting of pyrite, magnetite, epidote, and chlorite cross-cutting pink altered felsic volcanic rocks. The alteration zone occurs throughout the drill holes (227m in DC-06-1 and 272m in DC-06-2).

Highlights from Drill Hole DC-06-1

When analysing for basemetal and silver values, Copper, Silver, and Molybdenum were determined by ICP (inductively coupled plasma) after an aqua regia acid digestion. Assays exceeding 100 grams silver and 10,000 parts per million (ppm) copper were repeated using multi acid digestion and atomic absorption (AA). Check assays were run on high values.

Gold values were determined by fire assay extraction on 30 gram samples followed by an AA finish.

Preparations of the samples outlined in this news release were carried out by ALS Chemex in Thunder Bay and assaying was carried out by ALS Chemex in North Vancouver.

Mega Uranium Ltd (TSX-V: MGA) and East West Resource Corporation each hold a 50% interest in both the Hamlin and Deaty Shebandowan properties.

The project set out above is being supervised by R. Middleton, P.Eng. who is the Qualified Person and the person responsible for quality control of the assaying and reporting. More details are available on SEDAR at [www.sedar.com](http://www.sedar.com).

Mega Uranium Ltd. is a Toronto-based mineral resources company with a focus on uranium properties in Australia, Argentina, Mongolia and Canada. Further information on Mega can be found on the company's website at [www.megauranium.com](http://www.megauranium.com)
